Cotton Pest Management Guide 14-15

The **2014-15 Cotton Pest Management Guide** - your key resource for insect, mite and weed control, disease prevention, biosecurity and spray application information - is out now!

In this edition of the CottonInfo e-news, we bring you two of the key things you need to know from the Guide: the new **herbicide** and **insecticide resistance management strategies**.

If you've subscribed to receive a copy of the Cotton Pest Management Guide, your copy will be delivered to you in the post soon - in the meantime, you can download it in full from the [CRDC website](#).

Declare war on weeds!

The **herbicide resistance management strategy (HRMS)** is a tool for weed management in irrigated and dryland farming systems incorporating herbicide tolerant cotton **to delay glyphosate resistance.**

The Cotton Pest Management Guide contains the industry's **first** HRMS, which outlines the most effective way to delay resistance. **Find it on page 88.**

Part with your pests!

The **insecticide resistance management strategy (IRMS)** includes **all** activities commercially available for use in cotton targeting **all** pests. It should be consulted for **every** insecticide/miticide decision.

When used with the Impact on Beneficials table (page 8 of the Cotton Pest Management Guide), it allows growers to be pre-emptive and target pests without unnecessarily disrupting beneficials. **Find it on page 66.**
